Notation. There are several notations used for the inverse trigonometric functions. The most common convention is to name inverse trigonometric functions using an arc- prefix: $\arcsin(x)$, $\arccos(x)$, $\arctan(x)$, etc. (This convention is used throughout this article.) This notation arises from the following geometric relationships: [citation needed] When measuring in radians, an angle of θ ...

The inverse trigonometric functions are also known as the anti trigonometric functions or sometimes called as arcus functions or cyclometric functions. The inverse trigonometric functions of sine, cosine, tangent, cosecant, secant, and cotangent are used to find the angle of a triangle from any of the trigonometric functions.

MCQ on Inverse Trigonometric functions Quiz - Quizizz

In this section we focus on integrals that result in inverse trigonometric functions. We have worked with these functions before. Recall from Functions and Graphs that trigonometric functions are not one-to-one unless the domains are restricted. When working with inverses of trigonometric functions, we always need to be careful to take these restrictions into account.

Inverse Trigonometric functions. We know from their graphs that none of the trigonometric functions are one-to-one over their entire domains. However, we can restrict those functions to subsets of their domains where they are one-to-one. For example, $(y = \sin^{-1} x)$ is one-to-one over the interval $(\left[-\frac{\pi}{2}, \frac{\pi}{2}\right])$, as

1.8: Limits and continuity of Inverse Trigonometric functions

The trigonometric functions frequently arise in problems, and often it is necessary to invert the functions, for example, to find an angle with a specified sine. Of course, there are many angles with the same sine, so the sine function doesn't actually have an inverse that reliably "undoes" the sine function.
