Radial Engine

The radial engine is a reciprocating type internal combustion engine configuration in which the cylinders "radiate" outward from a central crankcase like the spokes of a wheel.

Radial engine - Wikipedia

A typical radial engine in a B-17 has nine cylinders, displaces 1,800 cubic inches (29.5 liters) and produces 1,200 horsepower. Radial engines have a relatively low maximum rpm (rotations per minute) rate, so they can often drive propellers without any sort of reduction gearing.

How Radial Engines Work | HowStuffWorks

A radial engine works like any other four-stroke internal combustion engine. Each cylinder has an intake, compression, power and exhaust stroke. They differ from inline and horizontally opposed engines in their firing order and they way they connect to the crankshaft

By utilizing air cooling, radial engines can be made lighter and less vulnerable than other configurations. Radial engines also use a shorter and smaller crankshaft. Since the crankshaft must be made from steel or cast iron, reducing the size of the crankshaft greatly reduces weight. The smaller crankshaft also reduces the siz

Car engines have been made in many formats; in-line. horizontally-opposed, V-block and so on. However so far as cars are concerned, probably the rarest type is the radial engine, in which the cylinders are arranged in a circle. In a four-stroke radial engine there has to be an odd number of cylinders to obtain a sensible firing order.
